

# A new approach towards PM<sub>2.5</sub> source apportionment in GAINS

Some lessons from South Asia

Gregor Kieseewetter

+ IIASA / CIAM (Markus Amann, Chris Heyes, Wolfgang Schöpp,...)

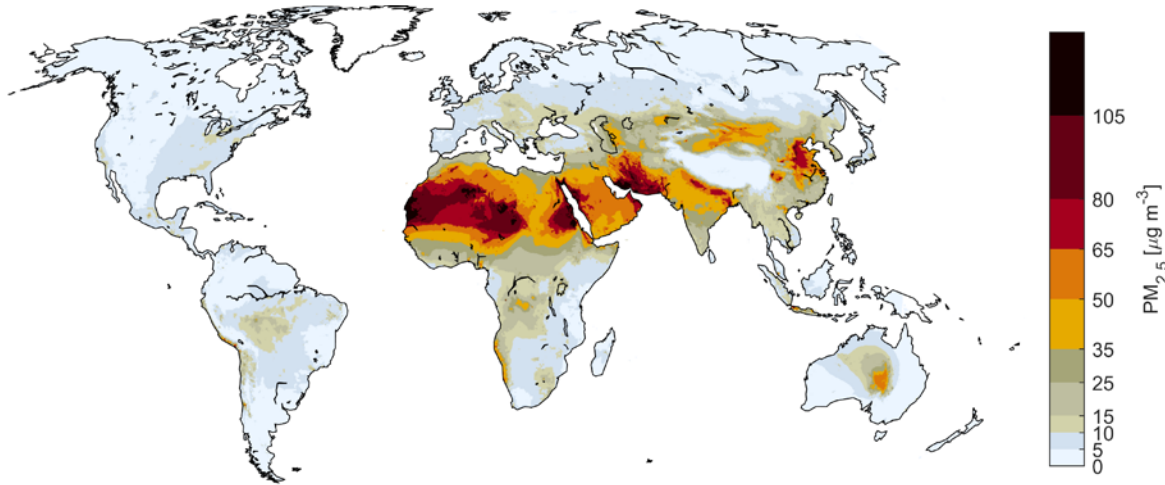

+ met.no / MSC-W (Hilde Fagerli, Agnes Nyiri, Peter Wind)

TFMM 2020 online meeting, 11 May 2020

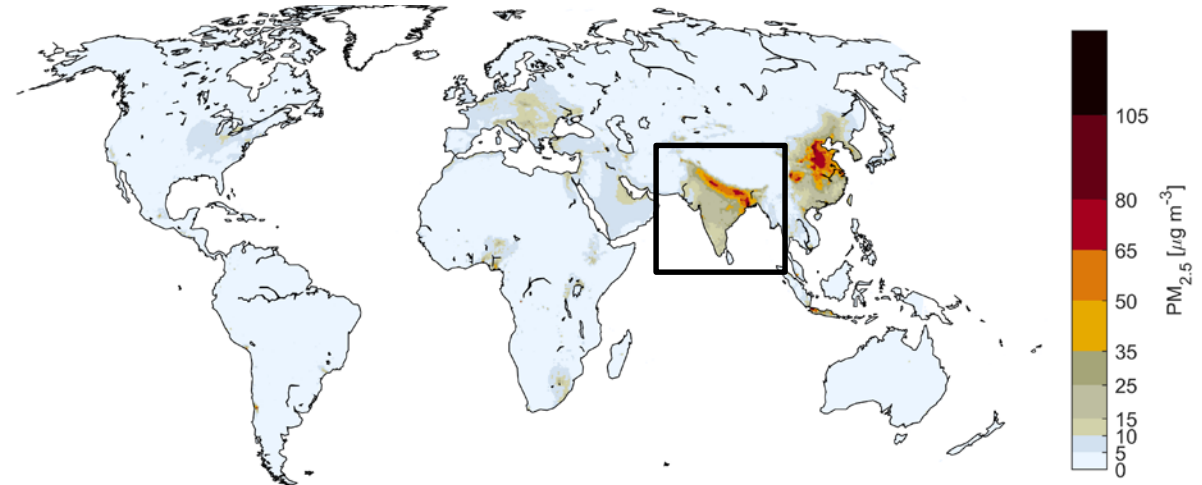

# Introduction

- South Asian cities are among the highest polluted in the world
- Objective: Develop sectoral and spatial source apportionments for  $PM_{2.5}$  in South Asia, for States and major cities

Total  $PM_{2.5}$  (2015, GAINS)

Anthropogenic  $PM_{2.5}$  (2015, GAINS)

# Introduction

- South Asian cities are among the highest polluted in the world
- Objective: Develop sectoral and spatial source apportionments for PM<sub>2.5</sub> in South Asia, for States and major cities
- Quantify the local and imported shares of PM<sub>2.5</sub> for states and for major cities
- Explore suitable airsheds for joint air quality management

# Methodology

- GAINS global transfer coefficients: linear approximation of EMEP CTM
  - 180 source regions globally (state level in India), region to grid, based on 15% reduction
  - high stack PPM and secondary PM precursors SO<sub>2</sub>, NO<sub>x</sub>, NH<sub>3</sub>, VOC: 0.5° x 0.5°
  - Low level sources PPM, SO<sub>2</sub>, NO<sub>x</sub>: 0.1° resolution (with urban/rural source distinction)
- Grid to grid tracking (“local fraction”) of PPM with EMEP CTM at 0.1°, monthly results, 2015, within ±8° of each receptor grid

=> sectoral transfer coefficients for PPM (currently only for lowest vertical layer):

$$T_{r,s,g} = \frac{1}{12} \cdot \sum_{m=1}^{12} \sum_{g'} \gamma(r,s,g') \tau(s,g',m) G(g',g,m)$$

$r$ ... source region,  $s$ ... source sector,  $g$ ... receptor grid cell (0.1°),  $g'$ ... emission grid cell (0.1°)

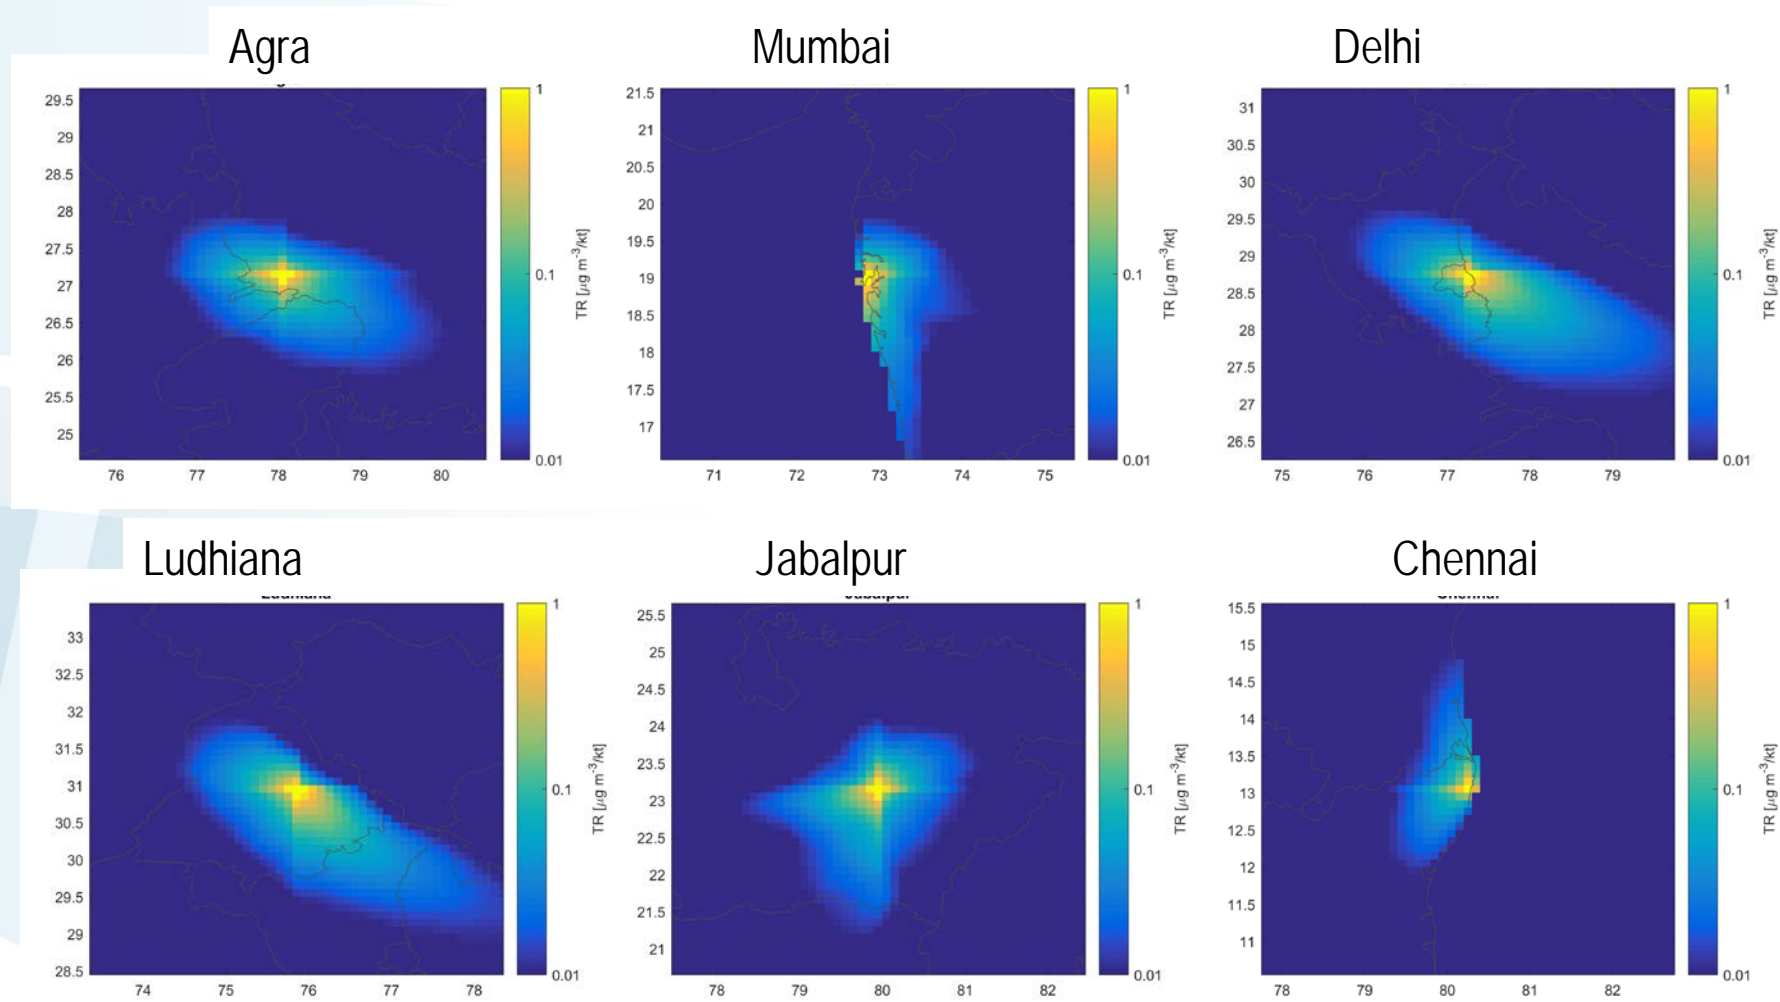

$\gamma(r,s,g)$  ... spatial emission distribution

$\tau(s,g,m)$  ... temporal (monthly) emission share

$G(g',g,m)$ ... grid-to-grid transfer coefficient from  $g'$  to  $g$  in month  $m$

# Fine-scale dispersion of low-level PPM emissions

- Examples of dispersion patterns of low-level PPM emissions from cities

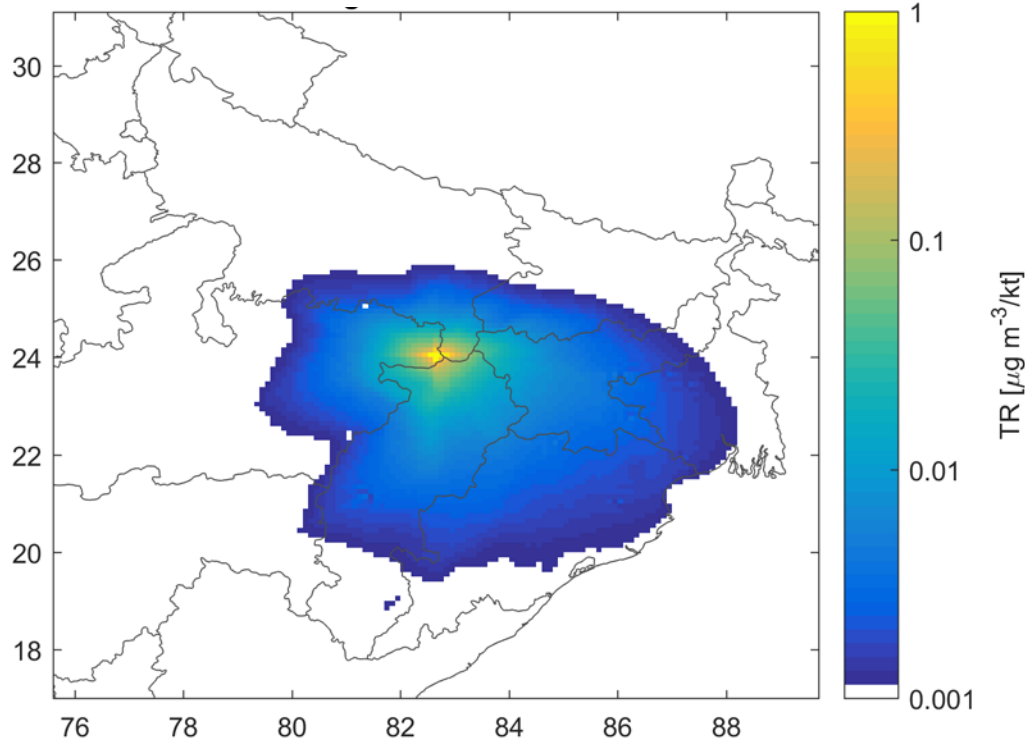

This enables analyses for individual cities!

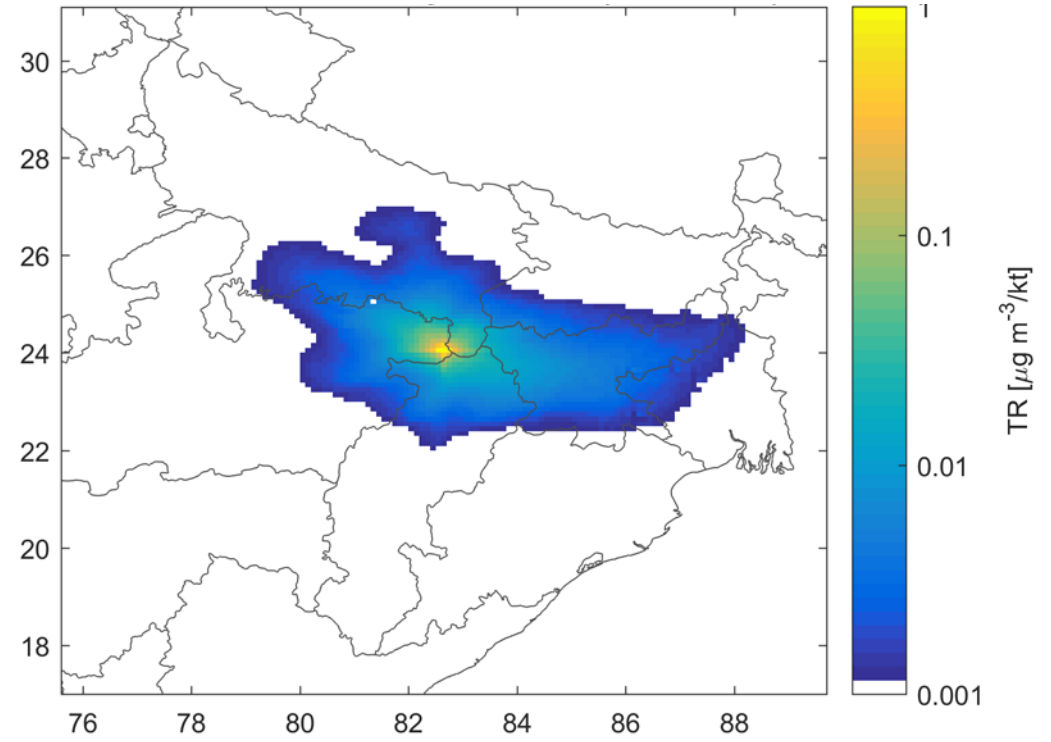

# Sectoral transfer coefficients

Annual mean dispersion pattern of PPM from 1 grid cell...

Domestic sector: ground level (0-50m)

Brick kilns: 0-90m, only in operation in dry season

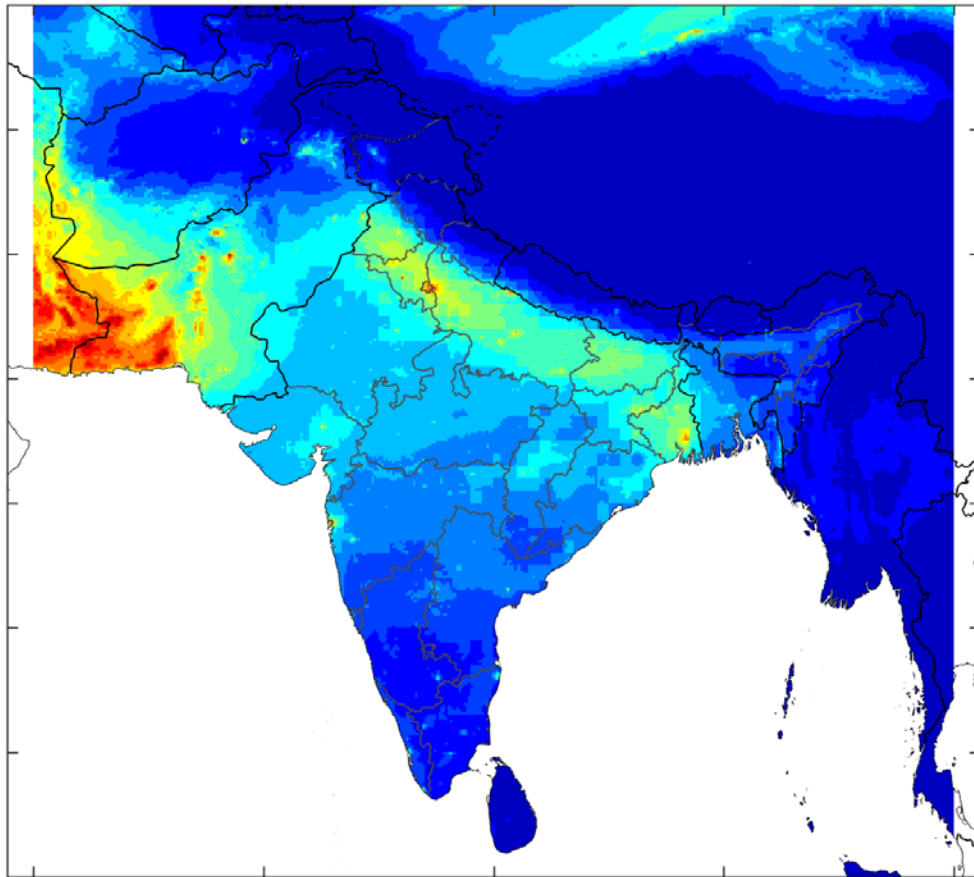

Temporal emission patterns matter!

# Recent improvements in emission inventories

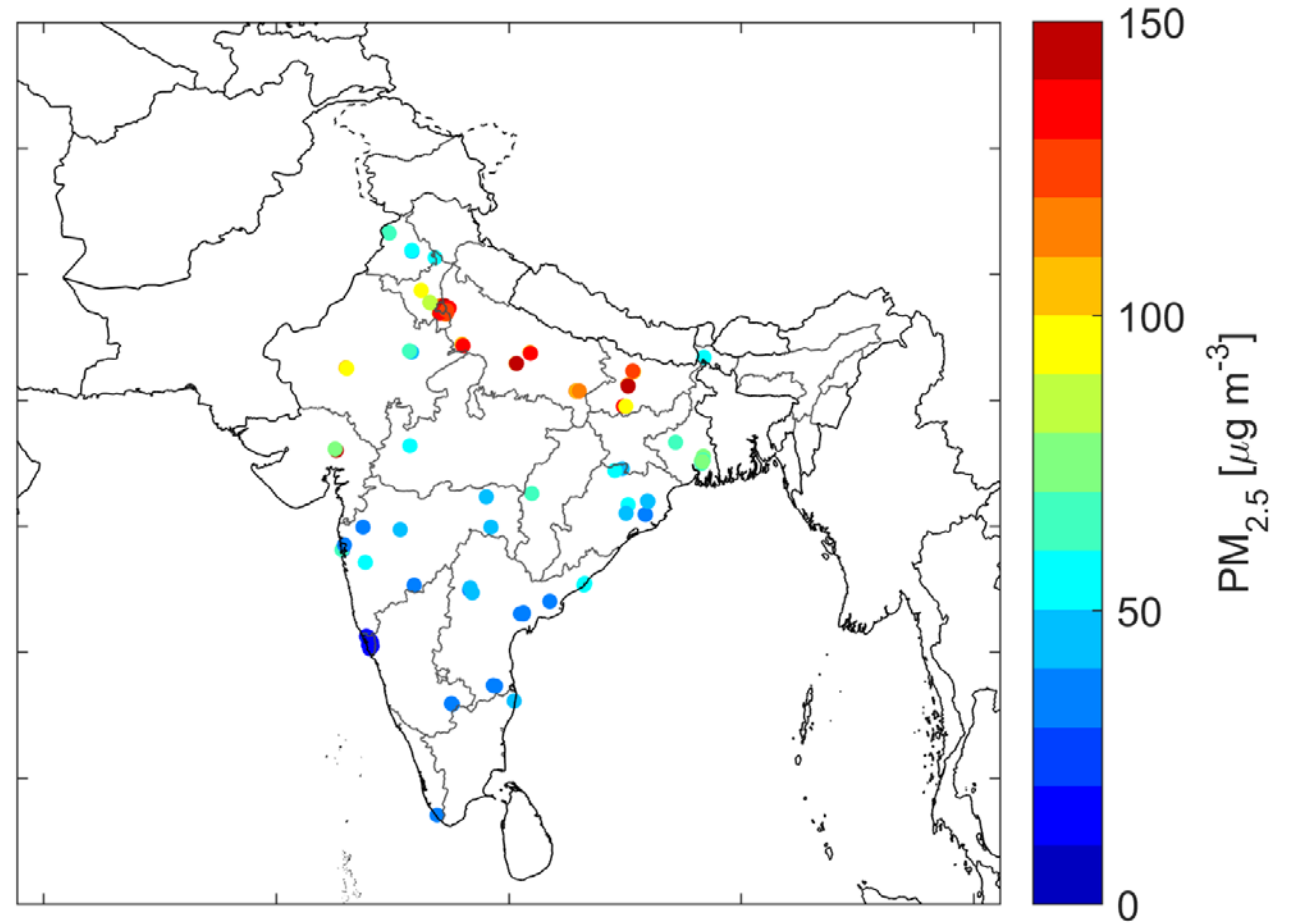

- Brick kilns
  - New spatial and temporal patterns
- Burning of agricultural residue
  - New spatial and temporal patterns derived from recent remote sensing products, but uncertainties about volumes remain
- Municipal waste burning
  - New estimates of waste quantities, burned volumes and locations
- Road transport
  - New data on traffic intensities by state, road maps, road dust non-exhaust emissions, urban/rural shares, real-life emission characteristics, recent control legislation

# Total PM<sub>2.5</sub> concentrations

GAINS, 2015

Observations, 2015-2018

# Validation of model estimates - India

Note that model calculations were conducted for 2015 meteorology with 2015 emission estimates.

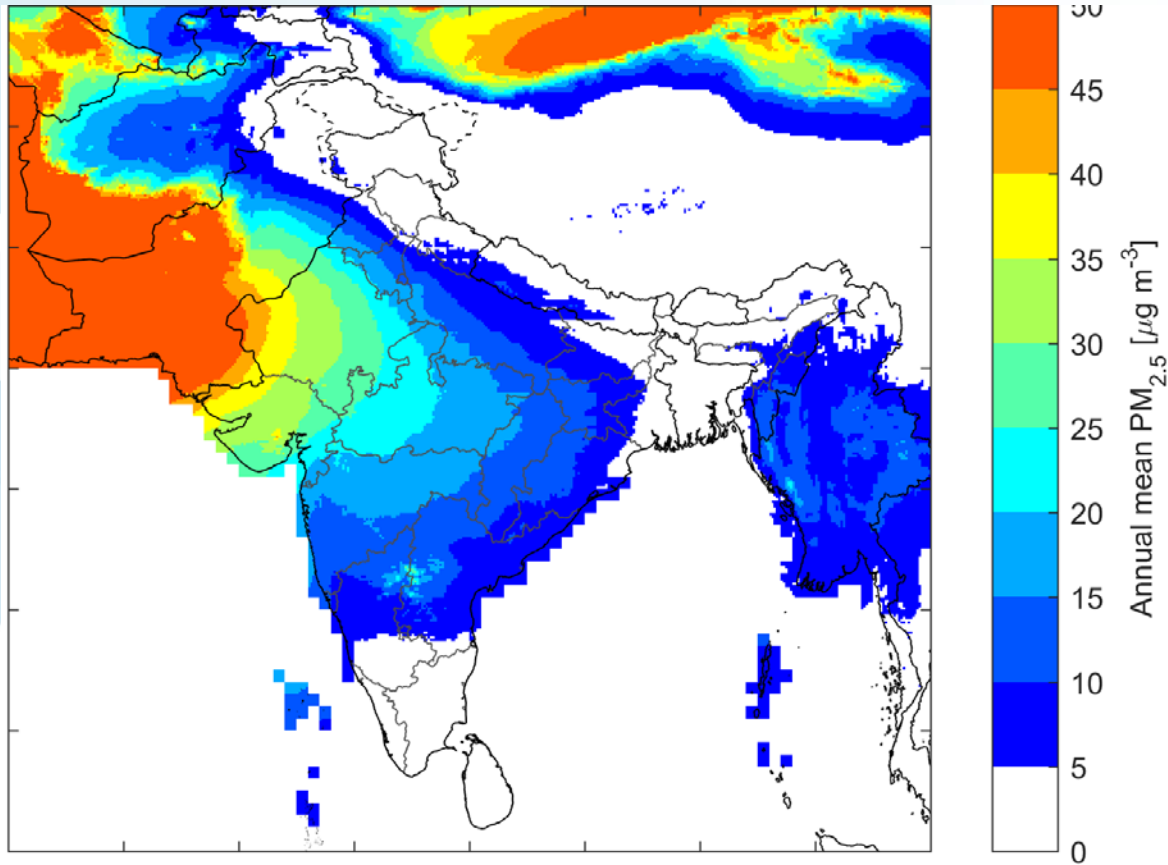

All monitoring data (PM<sub>2.5</sub> only, 2015-2018) were extracted from CPCB web site, only stations holding data for 11-12 months with more than 21 days/month considered .

# Sectoral contributions to PM<sub>2.5</sub>

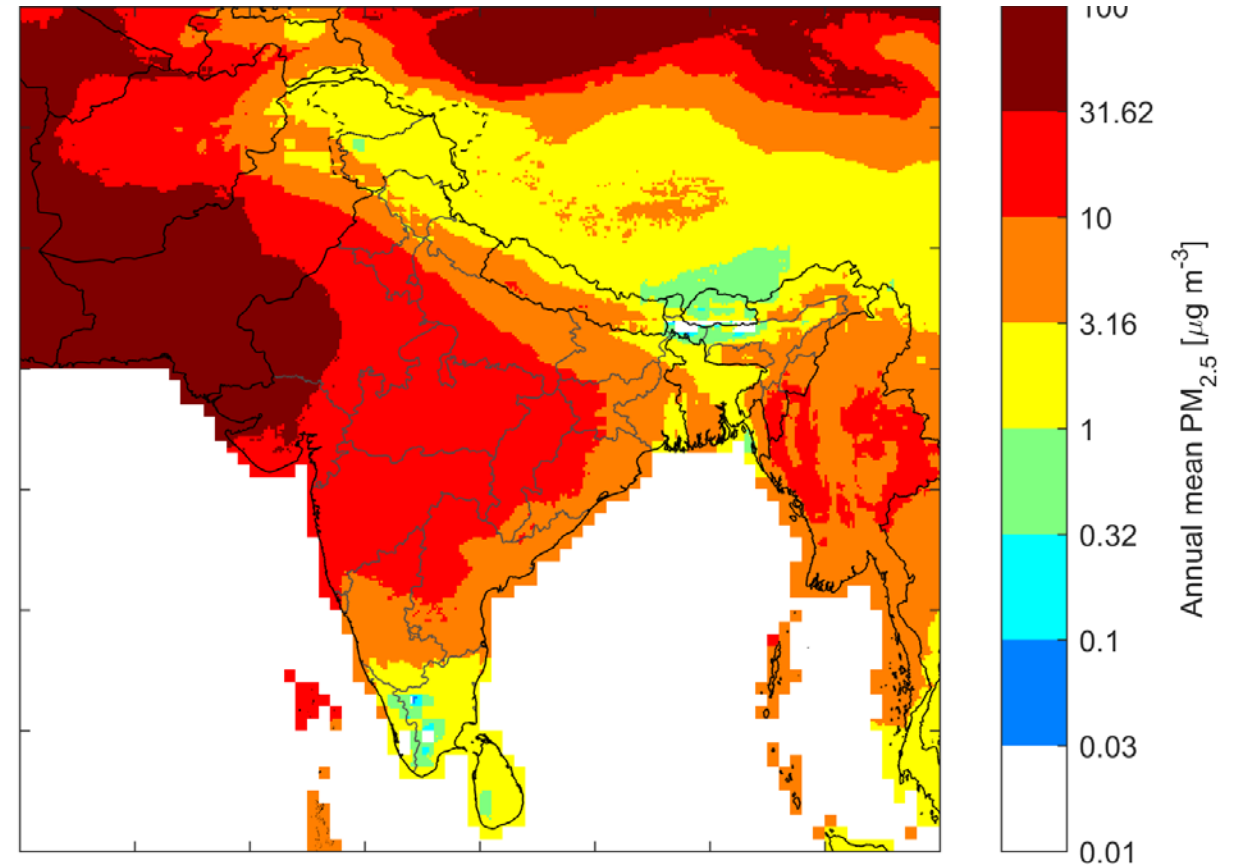

(examples for a few sectors...)

# Computed PM<sub>2.5</sub> concentrations: Natural sources, 2015

Linear scale

Logarithmic scale

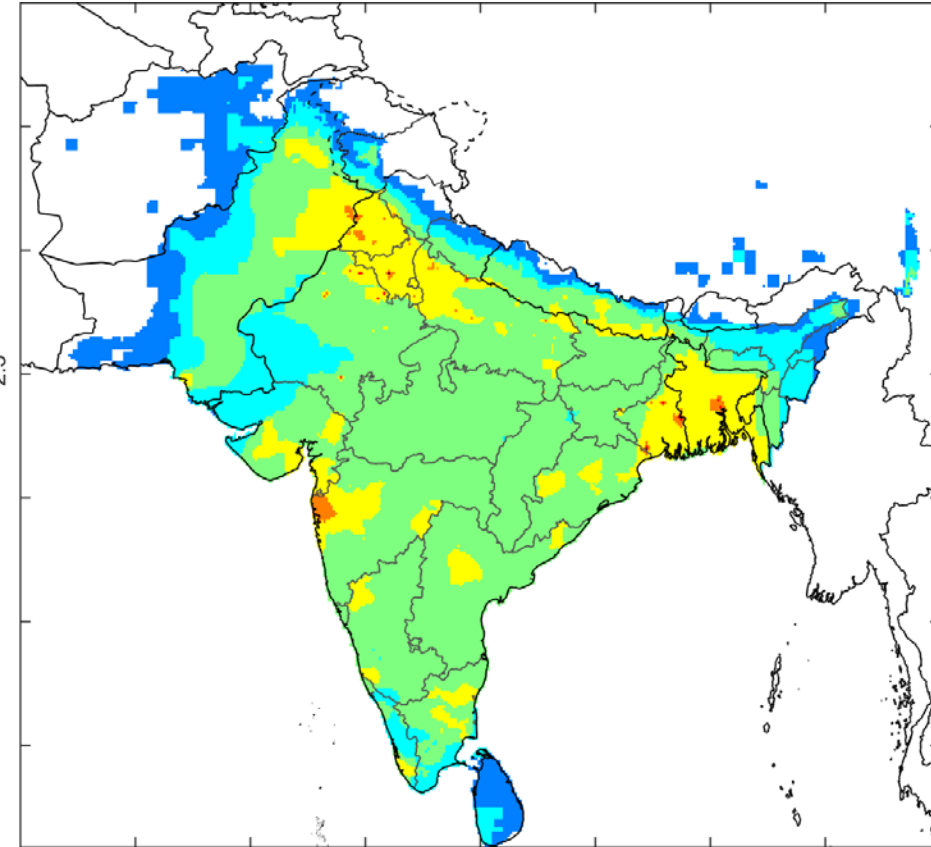

Preliminary results!

# Computed PM<sub>2.5</sub> concentrations: Brick kilns, 2015

Linear scale

Logarithmic scale

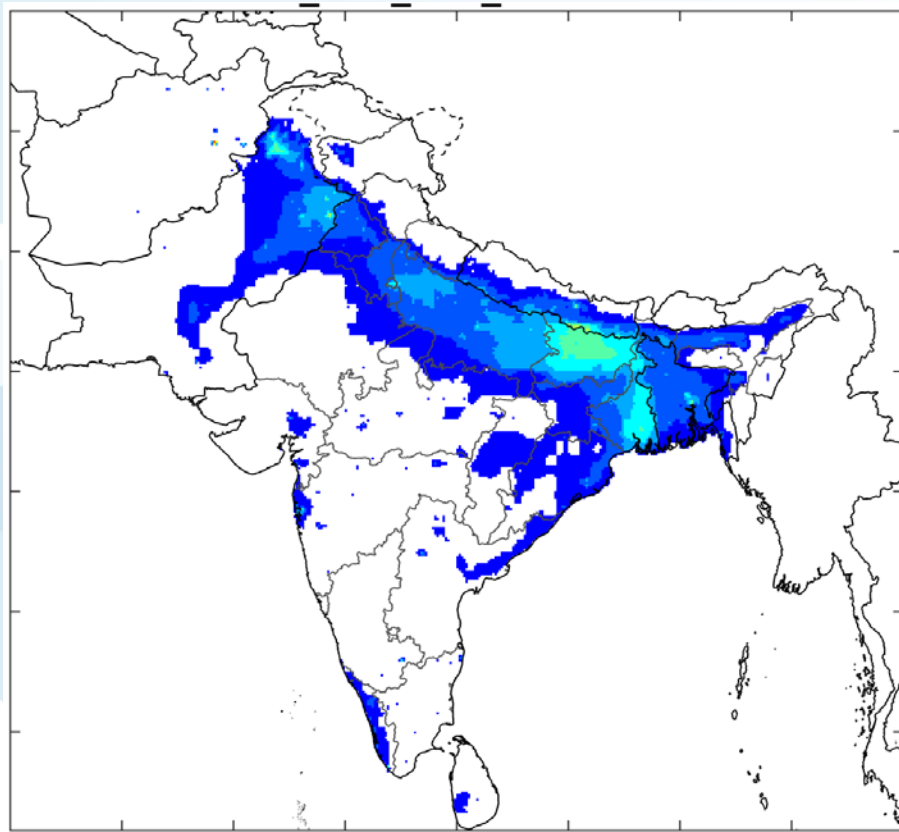

Mainly local contributions around brick production clusters in Northern states

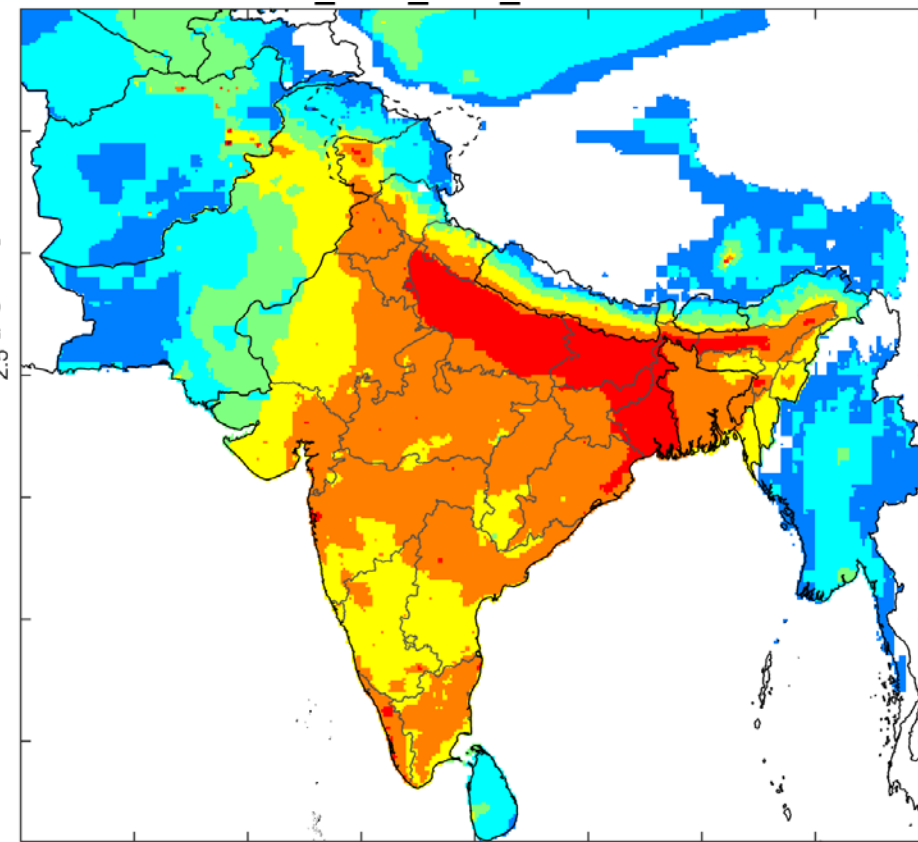

Preliminary results!

# Computed PM<sub>2.5</sub> concentrations: Residential & commercial, 2015

Linear scale

Logarithmic scale

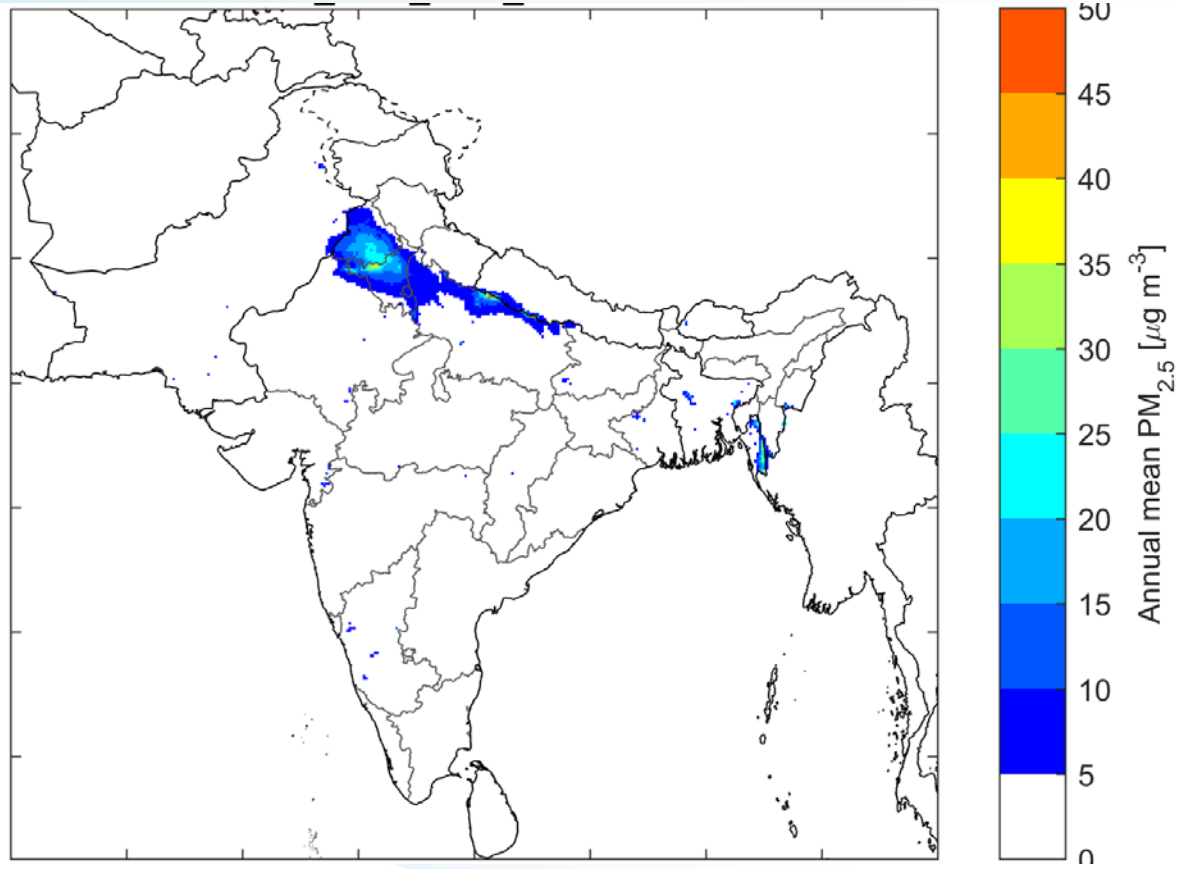

Mainly relevant in Gangetic Plain (Uttar Pradesh, Bihar...)

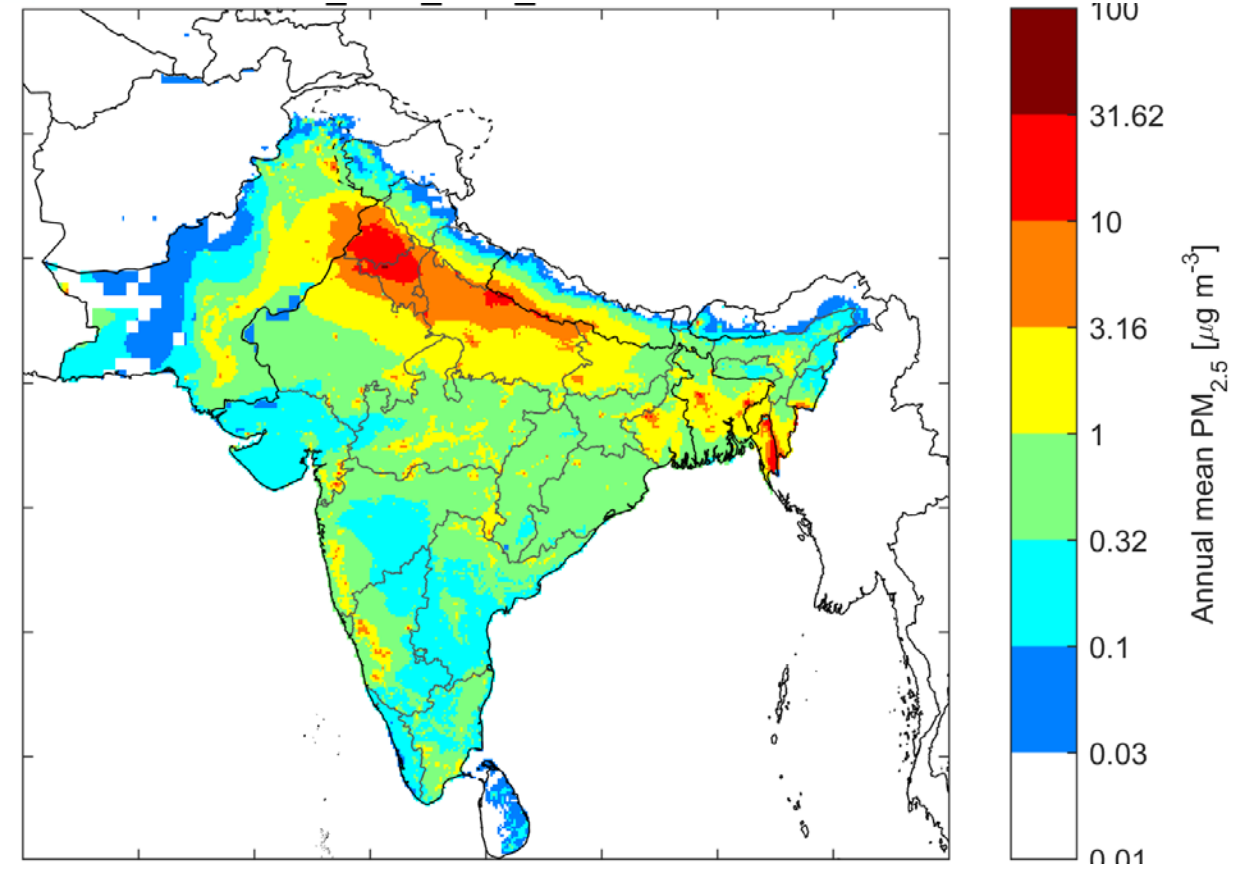

Preliminary results!

# Computed PM<sub>2.5</sub> concentrations: Agricultural residue burning, 2015

Linear scale

Logarithmic scale

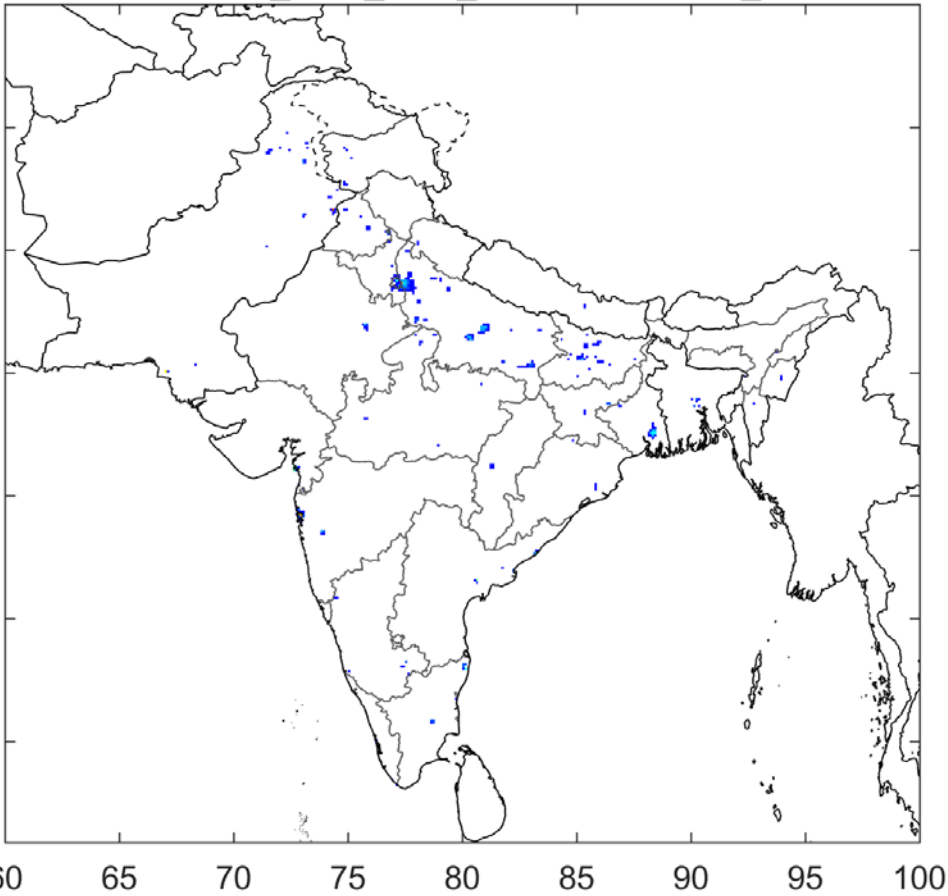

Mainly relevant in NW India, only during limited periods

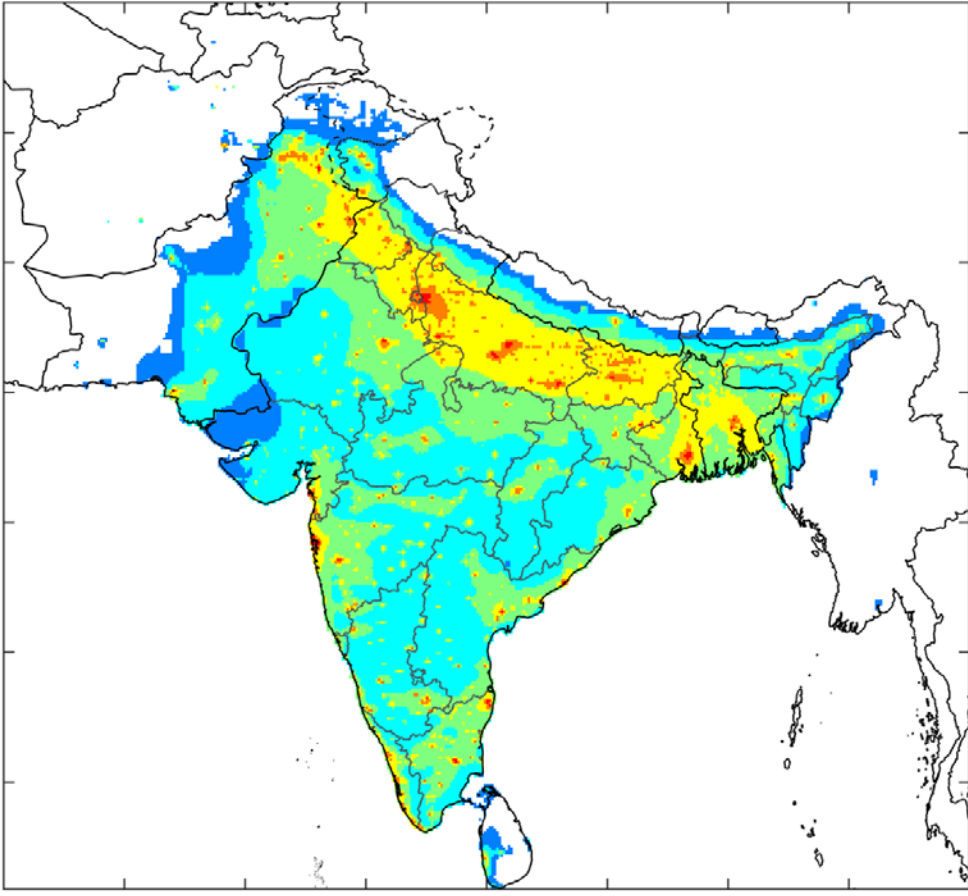

Preliminary results!

# Computed PM<sub>2.5</sub> concentrations: Waste burning in cities, 2015

Linear scale

Logarithmic scale

Significant local contributions...

Preliminary results!

# Contributions to PM<sub>2.5</sub> for Indian States (population-weighted)

# Contributions to PM<sub>2.5</sub> exposure in Delhi NCT

All PM<sub>2.5</sub> precursor emissions

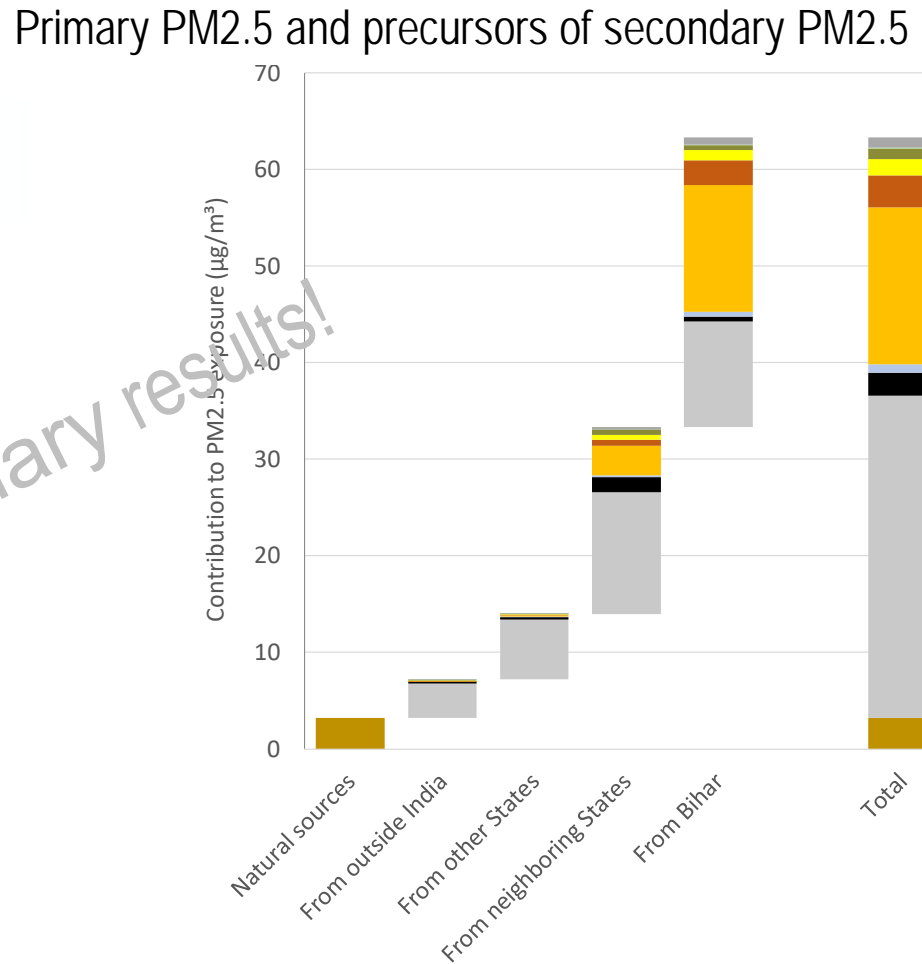

Primary PM<sub>2.5</sub> and precursors of secondary PM<sub>2.5</sub>

Preliminary results!

# Contributions to PM<sub>2.5</sub> exposure in Bihar

- Soil dust
- Small industries
- Transport
- Other
- Powerplants
- Residential
- Agri waste burning
- Livestock
- Industry high stacks
- Municipal waste

- Soil dust
- PPM High stacks
- PPM Residential
- PPM Transport
- PPM Livestock
- Secondary PM
- PPM Small industries
- PPM Municipal waste
- PPM Agri residue burning
- PPM Other sources

# Contributions to PM<sub>2.5</sub> exposure in Kerala

All PM<sub>2.5</sub> precursor emissions

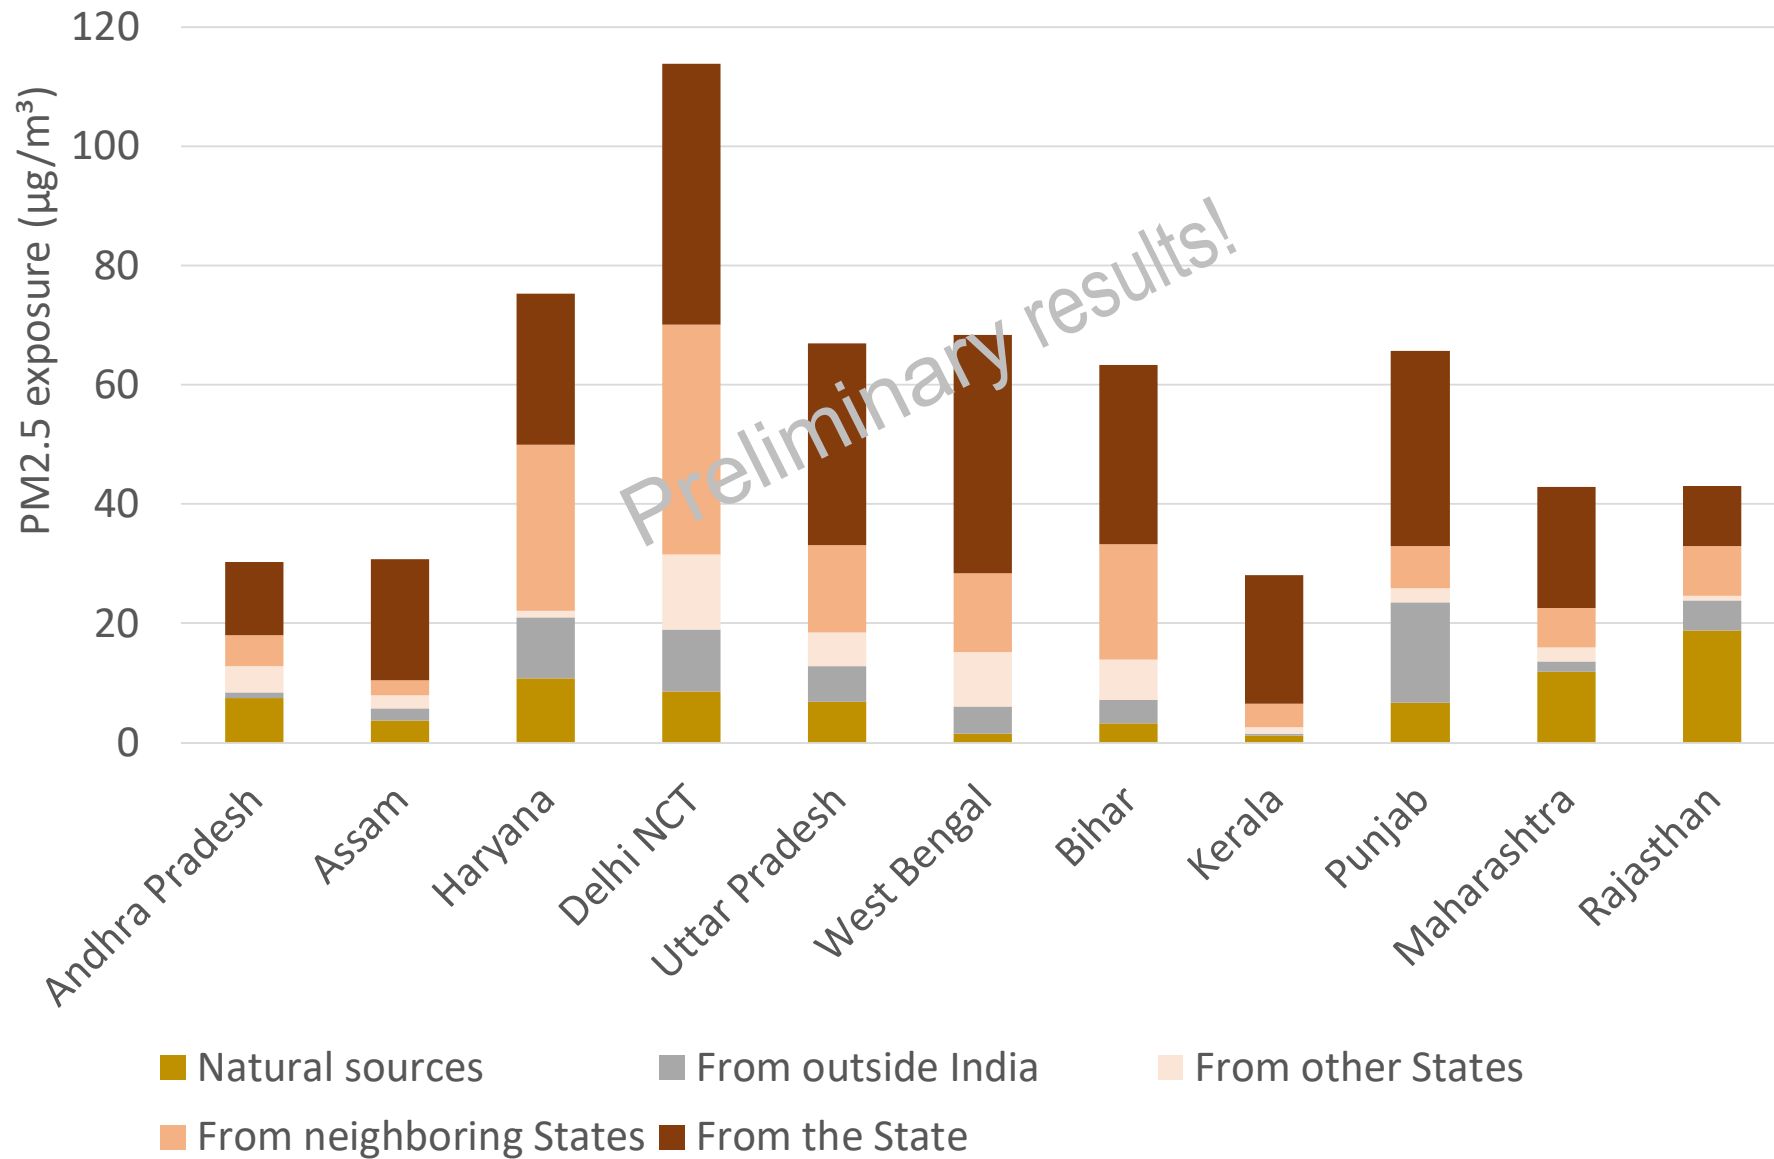

Primary PM<sub>2.5</sub> and precursors of secondary PM<sub>2.5</sub>

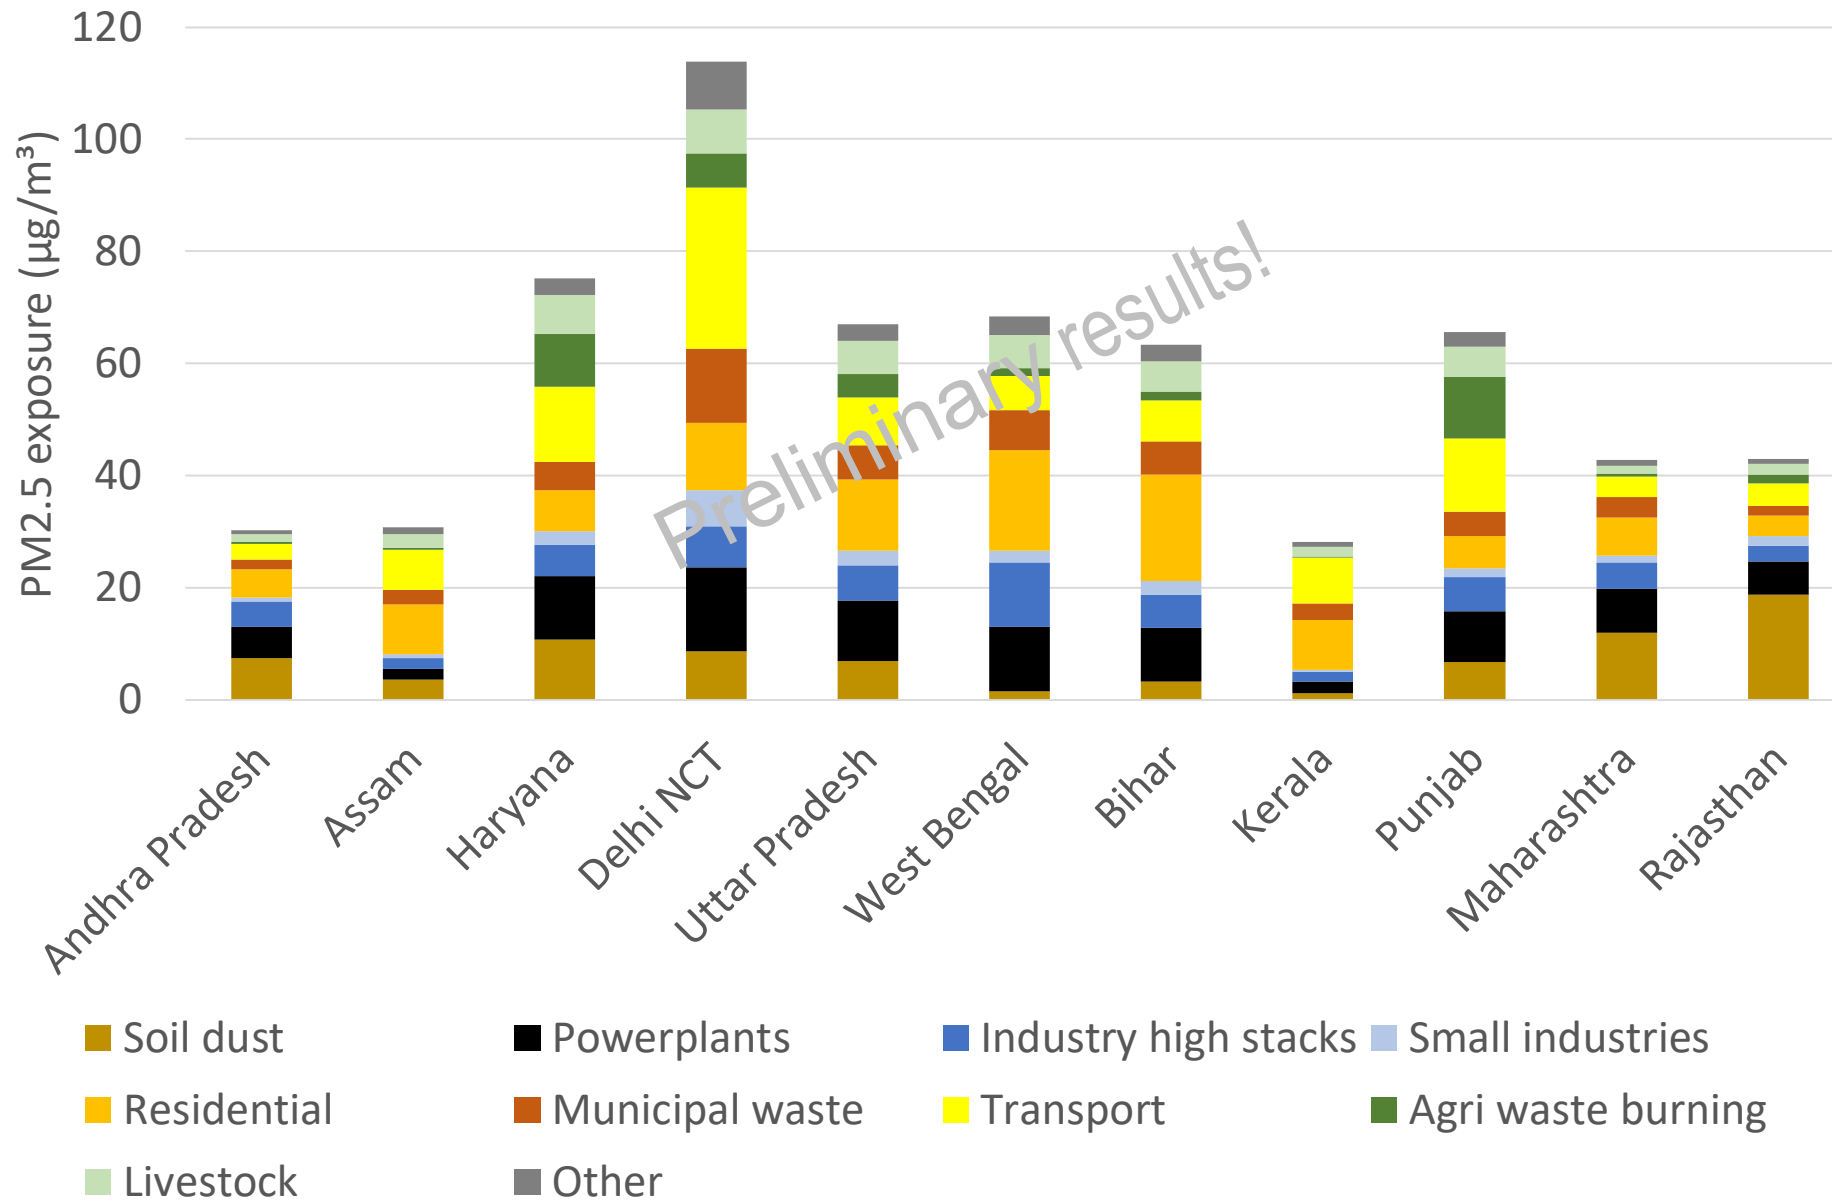

- Soil dust
- Powerplants
- Industry high stacks
- Small industries
- Residential
- Municipal waste
- Transport
- Agri waste burning
- Livestock
- Other

- Soil dust
- PPM High stacks
- PPM Small industries
- PPM Residential
- PPM Transport
- PPM Agri residue burning
- PPM Livestock
- Secondary PM
- PPM Other sources

# Spatial origin of PM<sub>2.5</sub> in Indian States, population-weighted

# Sectoral origin of PM<sub>2.5</sub> in Indian States, population-weighted

# Primary/secondary PM<sub>2.5</sub> – States, population-weighted

# Contributions to PM<sub>2.5</sub> in cities

Some examples...

# Contributions to PM<sub>2.5</sub> exposure in Kanpur

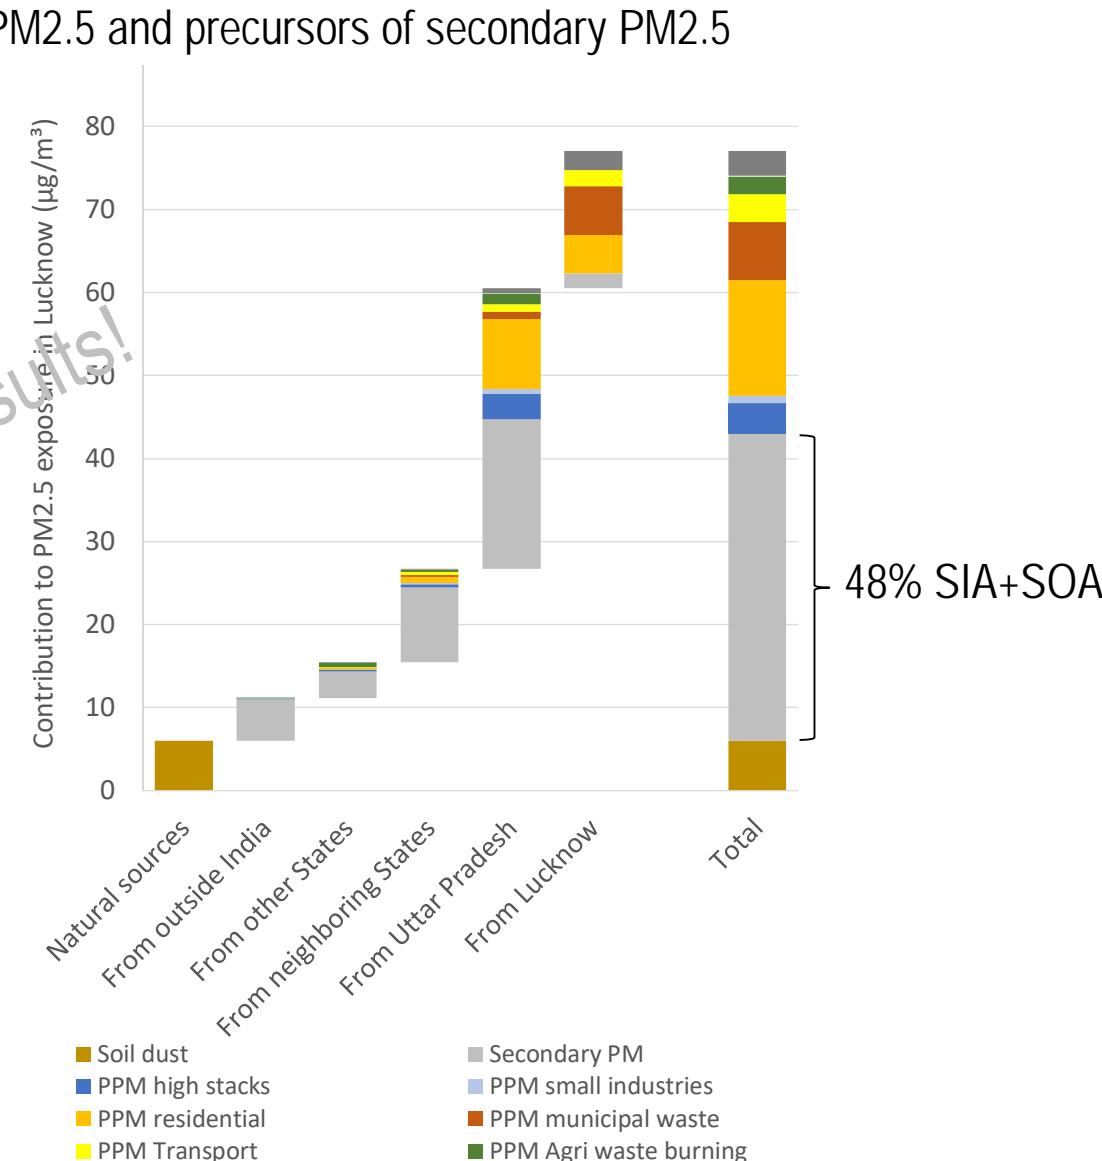

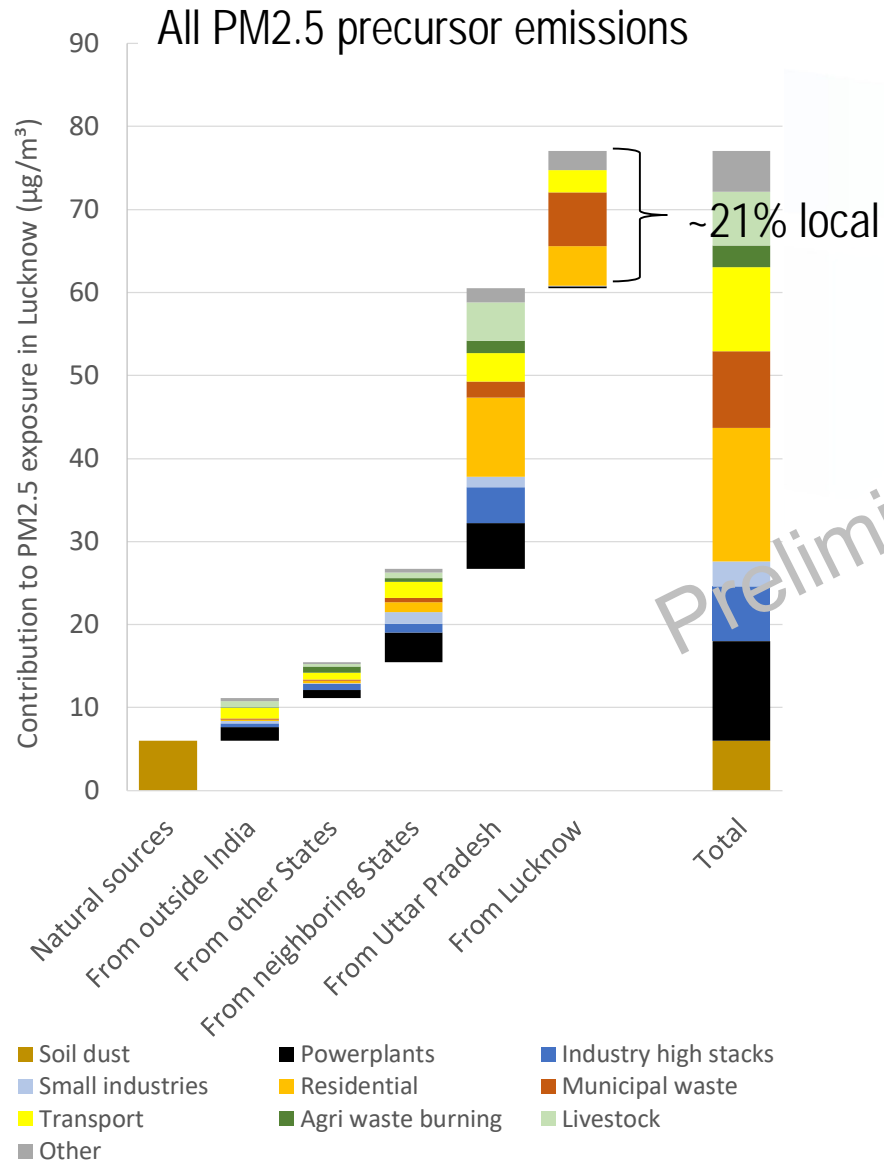

- Soil dust
- Powerplants
- Industry high stacks
- Small industries
- Residential
- Municipal waste
- Transport
- Agri waste burning
- Livestock
- Other

- Soil dust
- Secondary PM
- PPM high stacks
- PPM small industries
- PPM residential
- PPM municipal waste
- PPM Transport
- PPM Agri waste burning

# Contributions to PM<sub>2.5</sub> exposure in Lucknow

# Contributions to PM<sub>2.5</sub> exposure in Agra

All PM<sub>2.5</sub> precursor emissions

Primary PM<sub>2.5</sub> and precursors of secondary PM<sub>2.5</sub>

- Soil dust
- Powerplants
- Industry high stacks
- Small industries
- Residential
- Municipal waste
- Transport
- Agri waste burning
- Livestock
- Other

- Soil dust
- Secondary PM
- PPM high stacks
- PPM small industries
- PPM residential
- PPM municipal waste
- PPM Transport
- PPM Agri waste burning

# Some observations / (preliminary) conclusions

- Combination of traditional transfer coefficients with grid-to-grid tracking allows for improved ambient PM source apportionment in GAINS using sectoral transfer coefficients – work in progress...
- Importance of secondary PM<sub>2.5</sub> throughout India – a focus on the reduction of primary PM<sub>2.5</sub> will only address half of the problem.
  - Improved scientific understanding of the formation mechanisms/limitations of secondary PM<sub>2.5</sub> in India required
  - Improved emission inventories for NH<sub>3</sub> required.
- Clear evidence that cities cause only a limited share of their ambient PM<sub>2.5</sub> – implications for national clean air plans?
- The strong inter-State pollution transport in the Gangetic plain calls for an air shed AQM approach in this region. In other regions, there are strong linkages between cities and the surrounding State, but not so much across States.

# Next steps

- Further refinement of source attributions for some sectors (brick kilns in Bangladesh, Nepal, household fuel use, port emissions in Bangladesh and Sri Lanka, etc.)
- Updates underway to base year 2018
- Tracking of PPM from other vertical layers – done from EMEP model side, not yet implemented
- Downscaling below 0.1° resolution / testing of uEMEP approach...
- Scenario analysis, demonstrating benefits of emission mitigation policies
